17. Conclusion	32

1. Introduction

REPCoconnect is the company's all-in-one Human Resource Management System (HRMS). It brings together the everyday tasks employees and HR deal with — logging work hours, filing leave, viewing pay information, attending training, performance reviews, IT support, and company news — into a single website that staff can open from any modern web browser.

This document explains what each part of the system does and how to use it, written in plain, everyday language. It is meant for all employees, supervisors, HR staff, and administrators. The final section, System Features & Capabilities, is written for a more technical audience and describes the security and engineering details behind the system.

Use the Table of Contents to jump straight to the topic you need. Each section starts with a short “in simple terms” summary, followed by step-by-step instructions and helpful reference tables.

How to read this guide: Throughout this guide, words shown in bold (like File Leave or Submit) refer to buttons, menu items, or fields you will see on screen.

2. System Overview

In simple terms: REPCoconnect is a secure company website where you log in with your Employee ID, see a dashboard, and use the left-side menu to reach whatever you need.

2.1 Quick Facts

Detail	Information
System Name	REPCoconnect
Type	Human Resource Management System (HRMS)
Organization	Ryanon Electric Philippines Corporation (REPCO)
Who Uses It	Employees, Supervisors, HR, Accounting, IT/MIS, and Administrators
How to Access	Through any modern web browser (Chrome, Edge, Firefox)
Main Purpose	Manage the full employee journey — from time logging and leave to payroll, training, reviews, and IT support
Login Identity	Your Employee ID Number (used as your username)

2.2 What the System Covers

REPCoconnect is organized into modules. Each module handles one area of work. You only see the modules and actions your role allows.

2.3 Finding Your Way Around

After you log in, you land on the Dashboard. A navigation menu on the left lets you open any module. The bar across the top shows your notifications, your profile, and the current time. Whatever you click in the menu opens in the main area on the right.

SIDEBAR NAV	MAIN CONTENT AREA
Dashboard	Module Content Loads Here
Calendar	
Certification	
Finance	
Leave	
PR Form	
Training Evaluation	
Survey	
Employee Evaluation	
Employees	
MIS Ticket	
Profile Settings	
System Settings	
Feedback	

2.4 Roles & What They Can Do

The system gives each person access based on their role. Your role decides which modules and actions you can see and use.

Role	What They Can Do
Employee	Standard access — file leave, view pay info, submit forms
Supervisor / Manager	Approve leaves and evaluate team members
HR	Manage leave settings, employees, and evaluations
HR Manager	Senior HR access with extra approval authority
Clinic	Review and approve leave from a health/wellness view
IAD	Internal audit review step in leave approvals
Accounting	Access financial and payroll records
MIS / IT	Manage and resolve IT support tickets
Admin	Full system access — settings, uploads, approvals
News	Create and publish announcements

2.5 Logging In

1. Open REPConect in your web browser.
2. Type your Employee ID Number as your username.
3. Type your password.

4. Click Login.

Good to know: First-time login: If your account is flagged for a password change, you'll be asked to set a new password before you can use the system.

Account lockout: Too many wrong password attempts will temporarily lock your account. If that happens, contact the HR or administrator to unlock it.

2.6 Notifications

The bell icon at the top of the screen shows your in-app notifications. Click any notification to go straight to the record it refers to. You'll be notified about:

- Leave request results (approved or disapproved)
- PRF (request form) status updates
- New certificates uploaded for you
- Training assignments and evaluation requests
- MIS (IT support) ticket updates
- Finance events, such as a payslip being sent or a loan update

2.7 Logging Out & Changing Your Password

To log out, click your profile avatar or name in the top-right corner, then choose Logout. To change your password at any time, go to Profile Settings > Change Password. You'll need to enter your current password before setting a new one.

3. Leave Management

In simple terms: File your leave online, watch it move through the approvers, and keep an eye on how many leave days you have left.

The Leave module lets you file leave requests, track your leave balance, and follow the approval process. Approvers (Clinic, IAD, Managers, and HR) review requests from their own approval queues.

3.1 How a Leave Request Flows

A leave request normally passes through several reviewers in order. Some steps may be skipped depending on your department and position.

Note: Approval routing can vary by department and position. Some steps may be skipped based on the rules HR has set up.

3.2 How to File a Leave Request

1. Open Leave from the sidebar. Your leave history and current balances appear at the top.

2. Click File Leave (or New Request).
3. Fill in the leave form (see the fields below).
4. Click Submit. A control number (format LR-XXXXXX) is generated and shown.
5. Track your request under My Requests, where each approval step is shown in order.

Field	What to Enter
Leave Type	The type of leave (e.g., Sick, Vacation, Emergency)
Date From	Start date of the leave
Date To	End date of the leave
Number of Days/Hours	Calculated automatically or entered manually
Reason	Pick a reason from the dropdown
Sub-reason	Pick a sub-reason if one applies
Remarks	Optional extra explanation

3.3 What Each Status Means

Status	Meaning
Pending	Waiting for the current approver to act
Approved	Passed the current step
Disapproved	Rejected at a specific step
Cancelled	You cancelled the request
Completed	HR has given final approval

3.4 Cancelling a Leave Request

You can cancel an approved leave request within 3 days of HR's final approval.

1. Go to Leave > My Requests.
2. Find the request you want to cancel.
3. Click Cancel Request and confirm.

Important: After the 3-day window passes, you can no longer cancel through the system. Contact HR directly instead.

3.5 Approving a Leave Request (Approvers Only)

For Clinic, IAD, Managers, and HR:

1. Go to Leave > Pending Approvals (your approval queue).
2. Open the request assigned to your step.
3. Review the employee details, leave type and date, reason, and earlier approval steps.
4. Click Approve or Disapprove. If disapproving, enter a reason/remark.
5. Confirm. The employee is notified of your decision.

3.6 Understanding Your Leave Balance

Your balance appears at the top of the Leave module and shows the leave type, days Entitled, days Used, and days Remaining. Some leave types are non-deductible, meaning they don't reduce your balance — HR configures this.

3.7 Sunday Exemptions & Routing Rules

If a leave spans a Sunday, the system can be set to exclude Sundays from the day count — HR controls this per leave type. HR also sets routing rules (based on position and department) that decide which approvers are required. If no specific rule applies, the standard approval chain is used.

4. Finance & Payroll

In simple terms: View your pay-related records — allowances, loans, deductions, and savings. Regular employees get payslips by email; OJT trainees view theirs inside the system.

4.1 What You Can View

Section	What It Shows
OJT Payslips	Viewable in the system (OJT employees only)
Allowances	Current allowances (transportation, meal, etc.)
Loans	Active loans, balances, and deduction history
Deductions	One-time or recurring deductions
Savings	Accumulated savings and withdrawal records

4.2 How Payslips Are Delivered

Regular Employees — by email

For security, regular employee payslips are sent straight to your registered email and are not shown inside the system.

- Check your inbox each pay period for an email from payroll/accounting.
- Check your Spam / Junk folder if you don't see it.
- If your email is wrong, update it under Profile Settings > Personal Information, then ask HR to confirm the change.

OJT Employees — in the System

1. Open Finance from the sidebar.
2. Select OJT Payslip.
3. Your payslips for current and past periods appear — click one to see the breakdown (basic allowance, overtime, night differential, holiday pay, deductions, and net pay).

4.3 How Your Finance Records Are Organized

4.4 Viewing Loans and Savings

To view loans, go to Finance > Loans. Each loan shows its type, original amount, current balance, deduction frequency, and deduction history — click a row to expand. To view savings, go to Finance > Savings, where each savings type shows the total accumulated amount and any withdrawals.

4.5 Finance Administration (Admin Only)

Administrators manage finance records from the Admin Finance panel.

Add an Allowance

1. Go to Admin Finance > Allowances.
2. Select the employee and allowance type.
3. Enter the amount and effective date, then save.

Note: If the allowance type is set to “replace on upload,” a new allowance of the same type replaces the old one. Otherwise, it adds up (accumulates).

Add a Loan

1. Go to Admin Finance > Loans.
2. Select the employee and loan type.
3. Enter the principal amount and deduction frequency, then save.

Note: Some loan types are non-stackable — only one active loan of that type is allowed per employee at a time.

Upload a Payslip

1. Go to Admin Finance > Payslips.
2. Select the employee, payslip type, and pay period.
3. Upload the PDF file (max 5 MB), then save.

4.6 Financial Rates by Office

Each office can have its own rates, applied automatically during payroll calculation:

Rate Type	Description
OJT Allowance Rate	Daily rate for trainees
Night Differential	Extra pay for night-shift hours
Overtime Rate	Multiplier for overtime hours
Regular Holiday Rate	Pay rate on regular holidays
Special Holiday Rate	Pay rate on special / non-working holidays

5. Training & Evaluation

In simple terms: After a training, you fill out an evaluation form. It then goes to your supervisor and HR for review and approval.

5.1 How the Training Flow Works

5.2 Submitting a Training Evaluation (Employee)

- Go to Assessments > Training and find the training marked Pending Submission.
- Click the training title or Submit Evaluation.
- Answer the questions (multiple choice, rating scales, short/long text, Yes/No).
- Click Submit when all required questions are answered — it then goes to your supervisor.

Note: You cannot edit a submission after it has been submitted.

5.3 Evaluating a Training (Supervisor)

8. Go to Assessments > Training Approvals or open the notification.
9. Open the pending evaluation and review the employee's answers.
10. Fill in the Supervisor Evaluation: Result/Impact, Recommendation, and an Overall Assessment from 1 (poor) to 5 (excellent).
11. Click Submit Evaluation.

If you need the employee to redo or add to their evaluation, click Return for Re-evaluation and give a reason.

5.4 Confirming Supervisor Feedback (Employee)

After your supervisor submits, you may be asked to confirm you've read their feedback. Open the training in User Confirmation status under Assessments > Training, review the comments and rating, then click Confirm to move it to final approval.

5.5 Training Statuses

Status	Meaning
Pending Submission	You haven't submitted the evaluation yet
Submitted	Submitted; waiting for supervisor review
Supervisor Review	Supervisor is reviewing your submission
User Confirmation	You are reviewing the supervisor's feedback
Pending Final Approval	HR/admin is reviewing
Pending 2nd Final Approval	A second approver is reviewing
Completed	Fully approved and closed
Disapproved	Rejected somewhere in the process

5.6 Managing Trainings (Admin/HR)

To create a training, go to Assessments > Training Management, click Create Training, and fill in the title, date and time, speaker, objective, a survey template (the questions are copied from it), and the participants (all employees or specific people). In the training detail view, you can see each participant's submission status (Complete / Incomplete).

Administrators can also set routing rules for the supervisor step based on position and department, with up to 3 routing steps per rule.

6. Employee Evaluation (Performance Review)

In simple terms: Each quarter, you do a self-evaluation based on your task list, your supervisor scores you and gives feedback, and the result is approved and recorded.

6.1 How the Evaluation Flow Works

6.2 Fiscal Year & Quarters

Evaluations follow a May–April fiscal year:

Quarter	Months Covered
Q1	May, June, July
Q2	August, September, October
Q3	November, December, January
Q4	February, March, April

6.3 Completing Your Self-Evaluation (Employee)

12. Go to Assessments > Employee Evaluation and find the active period marked Pending.
13. Click Start Evaluation and review your pre-assigned task list for the quarter.
14. Click Submit to send it to your supervisor for scoring.

Note: You cannot change your submission once it is sent.

6.4 Supervisor Scoring

After you submit, your supervisor records a decimal task score for each task, plus 1–5 star ratings in five areas:

Category	What It Measures
Cost Consciousness	Mindfulness of company resources and costs

Category	What It Measures
Dependability	Reliability and consistency in work
Communication	Clarity and effectiveness of communication
Work Ethics	Professionalism and integrity
Attendance	Punctuality and attendance record

Supervisors also add written feedback — strengths, weaknesses, training required, general comments, and a space for the employee's own comments — and may optionally request a training (with an objective and preferred date).

6.5 Statuses, Timeline & Settings

Statuses follow the same pattern as training (Pending, Supervisor Review, Pending Final Approval, pending 2nd Final Approval, Completed, Disapproved). Every evaluation has a read-only Timeline tab showing a timestamped history of who did what and when. Administrators set the evaluation frequency (quarterly or monthly) and the fiscal year start (default May); these apply to all evaluations.

7. Survey System

In simple terms: HR and admins create surveys and send them to employees. Surveys can be anonymous and support many question types.

7.1 How the Survey Flow Works

7.2 Answering a Survey (Employee)

- Go to Assessments > Survey. Active surveys assigned to you are listed (completed ones show as Submitted).
- Click a survey title to open it and answer each question.
- Click Submit when done.

Note: You cannot edit your response after submitting. Some questions offer an “Other” option where you can type your own answer.

Supported question types include single choice, multiple choice, dropdown, rating, Likert scale, short text, long text, Yes/No, number, date, and linear scale.

7.3 Anonymous Surveys

If a survey is marked Anonymous, your identity is not attached to your answers. Admins see only combined results, not individual responses.

7.4 Survey Statuses

Status	Meaning
Draft	Being prepared; not visible to employees
Active	Live and accepting responses
Closed	No longer accepting responses

7.5 Templates & Results (Admin/HR)

To build a reusable set of questions, go to Assessments > Survey Templates and create a template — set each question's text and type, configure options and rating scales, mark questions required or optional, and use Section/Subsection types to organize long surveys. To launch a survey, go to Survey Management, click Create Survey, pick a template (its questions are copied in), set the title, target users, and anonymous flag, then set the status to Active.

Note: Editing a template later does not change surveys that were already created from it.

To view results, open a survey under Survey Management to see response counts and individual answers (when the survey is not anonymous).

8. MIS Ticket System (IT Support)

In simple terms: This is the IT helpdesk. Report a computer, software, or network problem, track its progress, or use the AI chat for instant help.

8.1 The Ticket Journey

8.2 Submitting an IT Support Ticket

18. Open MIS Ticket from the sidebar.
19. Click Create Ticket (or New Request).
20. Fill in the category, priority, subject, description, and the affected device (if any).
21. Click Submit. A ticket number like TK-25-001 is generated.

Categories

Category	Examples
Hardware	Computer won't turn on, broken keyboard, monitor issues
Software	App crashes, license problems, installation
Network	No internet, slow connection, Wi-Fi issues
Account/Access	Cannot log in, password reset needed
Printer/Scanner	Paper jam, driver issues, scanning errors
Email	Cannot send/receive email, account setup
Request for Parts	Need a replacement mouse, cable, etc.
Other	Anything not listed above

Priority Levels

Priority	When to Use
Low	Minor inconvenience; a workaround exists
Medium	Affects work but isn't blocking everything
High	Significantly impacts productivity
Critical	Complete work stoppage or data-loss risk

8.3 Tracking Your Ticket

Go to MIS Ticket > My Tickets to see the current status, diagnosis notes, and assigned technician.

Status	Meaning
Open	Submitted and waiting for assignment
In Progress	A technician is working on it
Resolved	Fixed; waiting to be closed
Closed	Fully completed

8.4 AI Chat Support

The AI Chat gives you instant help before filing a ticket. Go to MIS Ticket > Chat Support, type your question, and the assistant offers step-by-step troubleshooting and common fixes. If it can't solve the problem, you can create a ticket directly from the chat.

Privacy: Your chat is a private, one-on-one session. The IT team can review chat history to better understand reported issues.

8.5 Device Registry & Diagnosis (Admin/MIS)

The MIS team keeps a registry of devices (desktops, laptops, printers, scanners, phones, routers, monitors, projectors, UPS units, network equipment, peripherals, and more) that can be linked to tickets for better tracking. After investigating, technicians record a diagnosis — technician notes, recommendations, parts to replace, and an “immediate action required” flag — which the employee can see once submitted.

9. Personnel Request Forms (PRF)

In simple terms: Use PRFs to request official documents, process government and bank transactions, and apply for company benefits such as emergency loans and medicine allowances.

9.1 How a PRF Flows

9.2 PRF Types

Government Documents

Type	Description
PAG-IBIG Loan	Housing / multi-purpose fund loan request
SSS Sickness Benefit	SSS sick pay claim
SSS Maternity Benefit	SSS maternity leave pay claim
SSS Disability Benefit	Disability benefit claim
SSS Retirement Benefit	Retirement claim
BIR 2316	Certificate of Compensation
BIR 1902	Employee registration form
PHILHEALTH	PhilHealth membership / benefit requests

Banking & Finance

Type	Description
RCBC Bank	RCBC account-related requests
Bank Deposit Slip	Request for deposit processing

HR & Payroll

Type	Description
Payroll Adjustment	Corrections to pay computations
ID Replacement	Request for a replacement company ID
Certificate of Employment	Official employment certification
COE with Compensation	Employment + salary certification
Service Record	Record of employment service
Clearance	Pre-departure / resignation clearance
Emergency Loan	Company emergency financial assistance
Educational Loan	Company support for educational expenses
Medical Loan	Company support for medical expenses
Cooperative Loan	Cooperative loan facilitation
Medicine Allowance	Medicine reimbursement request
Uniform	Uniform request or replacement
Others	Any other HR-related request

9.3 Filing a PRF

22. Open PR Form from the sidebar and click File Request (or New PRF).
23. Choose the category (Government, Banking/Finance, HR & Payroll) and the specific type.
24. Fill in the form — fields vary by type (e.g., Emergency Loan asks for amount, deduction cut-off, and reason; Medicine Allowance asks for coverage dates and details).
25. Click Submit. A control number (format PR-XXXXXX) is assigned.

9.4 Tracking & Cancelling

Track your requests under PR Form > My Requests, where you'll see the status and any admin remarks.

Status	Meaning
Pending	Submitted and waiting for admin review
Approved	Processed and approved
Disapproved	Denied (see admin remarks)
Cancelled	Cancelled by the employee

You can cancel a PRF while it is still Pending: open it under My Requests, click Cancel, and confirm.

Note: Once a request is Approved or Disapproved, it can no longer be cancelled.

9.5 Admin PRF Processing

Administrators review pending PRFs under Admin > PR Form Management: open the request, review the details, click Approve or Disapprove, and add Admin Remarks (required when disapproving). The employee is notified of the outcome.

10. Announcements

In simple terms: This is the company's internal news feed. Read posts, react with emojis, and leave comments. Authorized staff can publish announcements with text, images, and videos.

10.1 Viewing, Reacting & Commenting

Open Announcements from the sidebar to see the feed (newest first). Each post shows a title, body text, any images or videos, emoji reactions, and a comment count. To react, click the reaction icon and choose an emoji. To comment, click the comment icon, type your message, and press Enter or Post — you can also Reply under any comment.

10.2 Creating an Announcement (Admin/HR/News Role)

26. Open Announcements and click Create Announcement (or the + button).
27. Fill in the form (see fields below).
28. Choose Save as Draft (visible only to admins) or Publish (visible to everyone immediately).

Field	What to Enter
Title	The announcement headline
Caption	Main body text (up to 2,000 characters)
Media	Upload images or videos (multiple allowed; drag to reorder)
Status	Draft (save for later) or Publish (live immediately)

Admins can also Edit a post, unpublish it (back to draft), or delete it permanently. For media, common image formats are JPG, PNG, and GIF; keep videos reasonably sized for fast loading, and drag items to set their display order.

11. Calendar & Timelogs

In simple terms: See company events and holidays on a shared calendar, and log your time-in and time-out for attendance.

11.1 Event Types & Repetition

Event Type	Description
Important	High-priority company notices
Meeting	Scheduled team or company meetings
Task	Task deadlines and assignments
Reminder	Personal or shared reminders
Deadline	Critical due dates
Legal/Special Holiday	Government-declared holidays
Day Off	Company-declared non-working days
Company Holiday	Internal company holidays

Events can repeat Once, Daily, Weekly, Monthly, or Yearly.

11.2 Viewing the Calendar

Open Calendar from the sidebar. It shows the current month by default. Use the < and > arrows to move between months, click a date to see that day's events, and click an event to view its details.

11.3 Creating an Event (Admin/HR)

29. Click a date on the calendar, or click Create Event.
30. Fill in the title, type, date/date range, repetition, description, and scope (all employees or specific members).
31. Click Save — the event appears for all selected participants.

When an event is scoped to specific members, only those people see it; events set to All are company-wide. Participants are notified when a new event is shared with them, and admins can see who has and hasn't viewed an event.

11.4 Logging Your Time

To clock in, open the Time log section in Calendar (or use the time-in button on the dashboard) and click Time In at the start of your day. At the end of the day, click Time Out. Both are recorded with a timestamp.

Note: Time logs are reviewed by HR and administrators for attendance monitoring.

12. Certifications

In simple terms: This is where your official certificates are stored. Admins upload them, and you get a notification when a new one is ready for you.

12.1 Viewing Your Certificates

32. Open Certifications from the sidebar — your certificates appear grouped by category.
33. Certificates you haven't opened yet show a “New” badge.
34. Click a certificate to open and view the PDF.

Note: Once you open a certificate, the “New” badge disappears and the system records that you've viewed it.

12.2 Uploading a Certificate (Admin)

35. Go to Admin > Certifications and click Upload (or Add Certificate).
36. Select the employee, choose a category, upload the PDF, and give it a name.
37. Click Save — the employee is notified that a new certificate is available.

Administrators can see all certificates across employees, who uploaded each one and when, and whether the employee has viewed it. The system records the first time each employee opens a certificate, which lets HR confirm important documents were received and reviewed.

13. Employee Profile Management

In simple terms: Your profile holds your personal and work details. You can update your own personal information, while HR and admins manage your work information.

13.1 What Your Profile Contains

13.2 Updating Your Personal Information

38. Open Profile Settings from the sidebar (or click your name/avatar in the top-right).
39. Click the section you want to change (Personal Information, Address, Emergency Contact, Family Background, Education, or Skills).
40. Click Edit, update the fields, and click Save.

To add a profile photo, open Profile Settings, click your photo (or the placeholder), choose an image (JPG or PNG, under the size limit shown), and confirm. If your present and provincial address are the same, turn on the “Same as Present Address” toggle to fill the provincial fields automatically.

13.3 Changing Your Password

41. Go to Profile Settings > Change Password.
42. Enter your current password.
43. Enter and confirm your new password, then click Save.

Note: Passwords must meet the system's security requirements.

13.4 Employee Directory (HR/Admin)

Authorized users open Employees from the sidebar to search all staff by name, department, position, or employment type, and click anyone to view their full profile. HR and admins can edit work information for any employee. The system also takes a daily snapshot of headcount (total, regular, probationary, OJT, and gender breakdown) for HR dashboards and reports.

14. System Feedback & What's New

In simple terms: Rate your experience with REPCoconnect, and stay informed when new features are added.

14.1 Submitting Feedback

A feedback popup appears from time to time after you log in. Choose a star rating from 1 (Very Unsatisfied) to 5 (Very Satisfied), optionally add a comment, and click Submit. You can also submit manually from the Feedback section in the sidebar if it's available.

Note: You can submit feedback once per calendar month. If you've already submitted this month, the popup won't ask again.

14.2 What's New (System Updates)

When new features or improvements are released, a What's New notification appears. Click it to read the update notes — which include the version number, new features, and bug fixes — then click Got It or Close to dismiss.

14.3 Feedback Administration (Admin)

Administrators can enable or disable the feedback popup for everyone, view all submitted feedback (ratings and comments), and review feedback trends over time. Feedback is used to improve the system and prioritize new features.

15. Troubleshooting Guide

In simple terms: Common problems and how to fix them yourself. If something here doesn't help, contact your IT/MIS team or HR administrator.

15.1 Login Problems

“Invalid credentials” error — Check that you're using your Employee ID number (not your name) as the username, make sure Caps Lock is off, and try typing your password in a text editor first to confirm it.

Account is locked — This comes from too many failed attempts. Don't keep trying; contact HR or IT to unlock it, then log in with the correct details.

Forced to change password — This is normal for new accounts or after an admin reset. Set a new password that meets the requirements shown, then continue to the dashboard.

Forgot password — Contact HR or the administrator to reset it. You'll get a temporary password or be prompted to set a new one.

15.2 Page Not Loading or Blank Screen

- Blank/white page: Hard refresh with Ctrl + Shift + R (Windows) or Cmd + Shift + R (Mac), clear your browser cache, log out and back in, or try a different browser.
- “Error” or “Something went wrong”: Refresh (F5), log out and back in, and if it persists, note the message and report it via an MIS ticket.
- Slow or timing out: Check your internet, close unused tabs, and try again shortly. If it happens on several devices, it may be a server issue — contact MIS/IT.

15.3 Leave Module Issues

- Can't see the "File Leave" button: Your balance may be zero or leave filing isn't set up for your position — check your balances and ask HR to verify your entitlements.
- Stuck on "Pending": See which step is pending in the request detail, follow up politely with that approver, or ask HR to reassign if they're unavailable.
- Can't cancel: The 3-day window may have passed, or the request isn't fully approved yet — contact HR to process it manually if needed.
- Wrong number of leave days: Check whether Sundays should be excluded for your leave type; if it's still off, ask HR to verify the settings.

15.4 Finance / Payslip Issues

How payslips work: Regular employees receive payslips by email (not in the system). OJT employees view payslips in Finance > OJT Payslip.

- No payslip email (regular employee): Check your Spam/Junk folder, confirm your email under Profile Settings > Personal Information, ask HR to correct it if wrong, and contact HR/Accounting if it's correct but nothing arrived.
- Can't find OJT payslip: Go to Finance > OJT Payslip, confirm the period was processed, and ask HR/Accounting if it's missing.
- Loan balance looks wrong: Review your deduction history, and contact HR/Accounting with specific dates and amounts if there's a discrepancy.

15.5 Training, Evaluation & PRF Issues

- Can't find assigned training: Check it's in Active status and confirm with HR/your supervisor that you're a listed participant.
- Evaluation form won't submit: Look for unanswered required questions (often marked with *), complete them, and retry.
- Evaluation stuck in "Supervisor Review": Follow up with your supervisor, or ask HR to reassign.
- Submitted wrong answers: Responses can't be changed once submitted — ask your supervisor or HR; they may return it for re-evaluation.
- PRF disapproved without a reason: Check the Admin Remarks field; if empty, contact HR for clarification.
- Can't cancel a PRF: Cancellation is only possible while Pending — for processed PRFs, contact HR or Accounting.

15.6 Profile, Notifications & Browser

- Can't upload a profile photo: Use JPG or PNG, keep it under 2 MB, and try a different browser if it still fails.
- Wrong work information (e.g., department): This is managed by HR/admin — contact them to fix it. You can update personal info yourself.
- Not receiving notifications: Check the bell icon for in-app notifications (always available), make sure the site isn't blocked in your browser, and confirm you're on the right account.
- Recommended browsers: Latest Chrome, Edge, or Firefox. Internet Explorer is not supported.
- Session expired (auto logout): For security, long inactivity logs you out — simply log in again.

15.7 If You're Still Stuck — Escalation Path

When reporting an issue, please include a clear description of the problem, the steps you took beforehand, any error messages (a screenshot helps), and the browser and device you're using.

16. System Features & Capabilities

This section is written for a technical audience. It documents the key features, functions, and security capabilities built into the REPConnect HRMS — what the system can do, how data is protected, and the technical behaviors that users and administrators should be aware of.

16.1 Core Functional Features

The system is organized into integrated modules covering the complete employee lifecycle:

Module	Key Functions
Login & Auth	ID-based login, account lockout, forced password change, avatar management
Employee Profile	Personal info, work info, address, education, family, skills, emergency contact
Leave Management	Multi-step approval routing, balance tracking, cancellation window, Sunday exemptions
Finance & Payroll	Payslip by email (regular) / in-system (OJT), loans, allowances, deductions, savings

Module	Key Functions
Training Evaluation	Survey-based assessments, multi-step supervisor review, routing rules
Employee Evaluation	Quarterly reviews, task scoring, star ratings, audit timeline
Survey	Configurable surveys with 11 question types, anonymous mode, template system
MIS Ticket	IT helpdesk with ticket tracking, AI chat, device registry
PRF	22 document/benefit request types with admin approval workflow
Calendar	Company event calendar with repetition, scope control, view tracking
Announcements	Company news feed with media, reactions, threaded comments
Certifications	PDF certificate management with “New” badge and view history
Feedback	Monthly system feedback (1–5 stars) and What's New release notes
Activity Logs	Immutable audit trail of all actions across the system
Notifications	In-app real-time notifications for all major events

16.2 Multi-Level Approval Workflows

Several modules use configurable multi-step approval chains to ensure proper review, accountability, and compliance.

Leave Approval Flow

Training Evaluation Flow

Employee Evaluation Flow

PRF Flow

16.3 Notification System

The system has a built-in, real-time in-app notification system.

Event	Who Gets Notified
Leave approved/disapproved at any step	Employee
PRF status changed	Employee
New certificate uploaded	Employee
Training assigned	Employee
Training evaluation step completed	Next approver
Employee evaluation step completed	Next approver
MIS ticket status changed	Employee
Finance event (payslip, loan update)	Employee
New system update (What's New)	All users

Notification scopes are either user-specific (sent to the directly affected employee) or general (sent to all users or a relevant group). Unread notifications show a count badge on the bell icon, clicking a notification navigates directly to the related record, and read/unread status is tracked per user.

16.4 Security Features

REPCONnect implements a defense-in-depth security architecture — multiple independent layers are stacked so that a bypass of one layer does not compromise the system. The subsections below document the security hardening measures present in the application.

16.4.1 Authentication & Session Security

Feature	Detail
ID-Based Login	Employees log in with their Employee ID, not email — reduces personal data exposure at the prompt
HttpOnly Cookie Storage	JWT tokens stored in HttpOnly cookies, not localStorage — JS cannot read them, preventing XSS-based token theft
Secure Cookie Flag	Cookies marked Secure=True in production — tokens never sent over plain HTTP
SameSite Cookie Policy	SameSite=Strict (HTTPS) / Lax (HTTP dev) — limits cross-site cookie sending, mitigating CSRF
Short-Lived Access Token	Access tokens expire after 15 minutes — limits exposure if intercepted
Refresh Token Rotation	Each refresh blacklists the old refresh token and issues a new one
Refresh Token Blacklisting	Used or revoked refresh tokens are rejected even within their expiry window
Logout Blacklisting	On logout the refresh token is blacklisted — session fully invalidated server-side
Forced Password Change	Admins can flag change_password=True; user must reset before access
Inactive Session Expiry	Inactive sessions expire when the access token lifetime ends with no refresh

16.4.2 Account Lockout & Brute Force Prevention

Two layers block brute force attacks. Layer 1 is a per-account failed-attempt counter: each failed login increments failed_login_attempts; when it reaches the configured maximum (default 5, configurable 1–20) the account locks until an admin unlocks it, and a successful login resets it to 0. Layer 2 is IP + user rate limiting: failed attempts are tracked per (IP, user) pair over a 15-minute sliding window, preventing bypass via many accounts from one IP.

Setting	Default	Range
Max failed login attempts	5	1–20
Account lockout enabled	Yes	On/Off
Password expiry days	90	1–3650 days

16.4.3 Token Rate Limiting

Request rate limits are enforced on sensitive endpoints; requests exceeding the limit receive a 429 Too Many Requests response.

Endpoint	Limit
Token refresh	30 requests / minute
AI Chat (MIS)	20 requests / minute
Anonymous API access	500 requests / hour

Endpoint	Limit
Authenticated API access	2,000 requests / hour

16.4.4 CSRF Protection

CSRF is blocked at two levels. Level 1 is Django's CSRF middleware: all non-safe methods (POST, PUT, PATCH, DELETE) require a valid CSRF token in the header, set via the `ensure_csrf_cookie` endpoint, with state-changing views decorated `@csrf_protect`. Level 2 is a cookie-JWT hybrid: the custom `CookieJWTAuthentication` class enforces a CSRF check before accepting the JWT for non-safe requests — a valid JWT alone is insufficient. GET, HEAD, and OPTIONS are exempt.

16.4.5 Input Validation

All user-submitted data passes through multiple validation layers. Serializer-level field validation includes `max_length` on all text fields, a username character whitelist (`^[\\w.@+-]+$`), a no-special-characters validator on name/profile fields, Philippine contact-number format checks, RFC-compliant email validation (including bulk import), and regex validators on name fields.

Password complexity is validated against a configurable `PasswordPolicy`:

Requirement	Default	Configurable
Minimum length	8 characters	6–128
Uppercase required	Yes	On/Off
Lowercase required	Yes	On/Off
Digit required	Yes	On/Off
Special character required	Yes	On/Off

Django's built-in validators add a layer: `UserAttributeSimilarityValidator` (too similar to username/name), `MinimumLengthValidator`, `CommonPasswordValidator` (known/breached passwords), and `NumericPasswordValidator` (all-numeric). Critical models also enforce consistency rules at the database layer via `clean()` methods (e.g., snapshot group counts cannot exceed total headcount).

16.4.6 Race Condition Prevention

Concurrent operations that could corrupt data are protected with pessimistic locking and atomic transactions.

Protection	Where Applied
<code>select_for_update()</code> row-level locks	Employee status updates, password resets — prevents simultaneous modification of the same record
<code>@transaction.atomic</code> view decorator	Admin status view, password reset — all-or-nothing execution
<code>with transaction.atomic()</code> block	Bulk employee import — partial imports fully rolled back on error
<code>transaction.atomic()</code> on snapshots	Daily employee snapshots — prevents duplicate/partial snapshots
<code>transaction.on_commit()</code> for audit logs	Log writes deferred until after commit — never written for rolled-back ops

16.4.7 Idempotency Keys

Admin operations that must not run twice (e.g., locking an account, resetting a password) support an idempotency key. The client sends a unique X-Idempotency-Key header; the server caches the key for 60 hours and, if the same key is replayed within that window, returns the cached response instead of re-executing — preventing duplicate mutations from network retries or double-clicks.

16.4.8 File Upload Security

Upload Type	Validations Applied
Profile Photo	JPG/PNG only; content verified with Pillow (blocks MIME spoofing); max 2 MB
OJT Payslip PDF	Extension .pdf only; max 5 MB
Certificate PDF	Extension .pdf
Announcement Media	jpg, jpeg, png, gif, webp, mp4, webm, ogg; MIME checked vs. content; max 50 MB
Employee Import	.xlsx, .xls, or .csv only (case-insensitive)
Global Upload Limit	DATA_UPLOAD_MAX_MEMORY_SIZE 52 MB; FILE_UPLOAD_MAX_MEMORY_SIZE 5 MB

MIME spoofing prevention: profile photos are opened and verified with the Pillow image library — if the content is not a valid image (even with a .jpg extension), the upload is rejected.

16.4.9 SQL Injection & XSS Prevention

SQL injection is fully mitigated: all database operations use the Django ORM (QuerySet API), which automatically parameterizes user-supplied values; no raw SQL (Manager.raw() or cursor.execute()) exists in any view or model; and MySQL Strict Mode (STRICT_TRANS_TABLES) rejects invalid values at the database level.

XSS Measure	Description
API-only backend	Serves only JSON — no server-rendered HTML, eliminating server-side XSS
JSON-only renderer	DRF configured with JSONRenderer only — no browsable API HTML in production
HttpOnly JWT cookies	Tokens cannot be accessed by injected JavaScript
Content-Security-Policy	Headers restrict which scripts the browser may execute
SECURE_CONTENT_TYPE_NOSNIFF	X-Content-Type-Options: nosniff prevents MIME-sniffing into executable types
Write-only password fields	Password fields are write_only — never returned in responses
Admin panel escaping	Django admin uses conditional_escape() for HTML output

16.4.10 HTTP Security Headers & CORS

Header	Value	Protection
X-Content-Type-Options	nosniff	Prevents MIME-type sniffing

Header	Value	Protection
X-Frame-Options	DENY	Prevents clickjacking via iframes
Referrer-Policy	strict-origin-when-cross-origin	Limits referrer URL leakage
Strict-Transport-Security	Enabled in prod (subdomains + preload)	Forces HTTPS for future requests
Cache-Control	no-store, private on /api/*	Prevents caching of sensitive responses
Pragma	no-cache on /api/*	Legacy cache prevention

CORS: allowed origins are whitelisted via environment variable, CORS_ALLOW_CREDENTIALS=True enables cookie-based JWT cross-origin, and the CORS middleware is placed first in the stack so headers are evaluated before authentication. Requests from unlisted origins are blocked by the browser before reaching the API.

16.4.11 Password, Payslip & Sensitive Data Security

Passwords use PBKDF2+SHA256 (salted); plain-text passwords are never stored, password fields are write-only, admin password-reset responses return only the employee ID and status (never the new password), admins cannot lock or reset their own account, and Admin/HR/Accounting accounts cannot be modified via standard employee admin endpoints.

Regular-employee payslips are delivered exclusively by email and never stored or displayed in-system, keeping salary data inaccessible even if a session or device is compromised. OJT payslips (training allowance breakdowns) are stored in-system as they contain non-sensitive data. Additional protections include write_only password fields across serializers, a read-only base UserSerializer (no user data overwritten via response payloads), and stack traces hidden from non-admin users.

16.4.12 Logging, Secrets & Monitoring

Every authenticated request records network-level identifiers: the IP address (from X-Forwarded-For in production behind a reverse proxy, or REMOTE_ADDR in development — the forwarded header is only trusted in production to prevent spoofing) and a MAC address (from a custom header or the server's interface where available). These are stored in the immutable activity log for forensic analysis.

All sensitive configuration (SECRET_KEY, database credentials, JWT signing key, CORS origins, SSL settings, external webhook URLs) is loaded from environment variables — nothing is hardcoded; a missing webhook URL raises ImproperlyConfigured at startup. Secure defaults apply: DEBUG defaults to True for dev (set False in production), JWT_COOKIE_SECURE defaults to not DEBUG, and SECURE_HSTS_SECONDS defaults to 0 to prevent accidental HSTS lockout.

Application errors (4xx, 5xx, validation errors, and unhandled exceptions with full stack traces) are captured in a structured, searchable log. Stack traces are visible only to admins; regular users see a generic error message. Logs are output as machine-readable JSON with rotating file handlers (up to 5 backups of 10 MB each).

16.4.13 Security Architecture Summary

16.5 Audit & Activity Logging

Every action by an authenticated user is recorded in an append-only activity log; these records cannot be modified or deleted. Each entry captures the user, module, action (create/update/approve/delete), HTTP method, endpoint, IP address, MAC address (where available), and timestamp. Employee evaluations additionally have a dedicated, read-only Timeline tab recording each status change, approval, and confirmation with actor and timestamp. Audit logs support investigating unauthorized access, tracing approvals/modifications, compliance and HR audits, and dispute resolution.

16.6 Access Control & Permissions

The system uses a flat permission-flag model; each user can hold one or more roles simultaneously.

Role Flag	Module Access
admin	Full system access — all modules, configuration, data management
hr	Employee management, leave configuration, evaluation management, payroll
clinic	Leave approval (Clinic step)
iad	Leave approval (IAD step)
accounting	Finance and payroll records
mis	MIS ticket management and resolution
news	Create and publish announcements

Each page/action checks whether the user holds the required flag; if not, the action is blocked with a 403 Forbidden. Employees with no special flags have standard access. Flags are assigned and managed by the admin role only.

16.7 Data Integrity & Reliability

Major transactions receive unique, system-generated, sequential control numbers that cannot be manually edited:

Module	Format	Example
Leave Request	LR-XXXXXX	LR-000123
PRF Request	PR-XXXXXX	PR-000456
MIS Ticket	TK-YY-NNN	TK-25-001

A daily employee snapshot preserves headcount (total, regular, probationary, OJT, and male/female breakdown) for historical accuracy. Soft deletion preserves foreign-key references using set-null behavior rather than cascading deletes, so removing a record (e.g., a position) does not erase tied historical data. Singleton settings (Evaluation, Feedback, Update) ensure exactly one configuration record exists system-wide.

16.8 File Management

Feature	File Type	Size Limit
Profile Photo	JPG, PNG	Standard image size
Certificate	PDF	No explicit limit
Payslip (OJT)	PDF	5 MB maximum
Announcement Media	Images, Videos	Browser-reasonable size

Uploaded files are stored on the server with file names tracked internally; the original filename is preserved for reference (certificates record both the stored and original names).

16.9 AI-Assisted Support

The MIS Ticket module includes an AI Chat that answers common IT questions immediately, guides users through step-by-step troubleshooting, suggests solutions for hardware/software/network issues, and lets users escalate to a formal ticket directly from the chat when an issue cannot be resolved.

Each employee has a private, one-on-one chat session not visible to other employees; the MIS/IT team can review chat history to better understand reported issues.

16.10 System Configuration & Flexibility

Administrators can configure many behaviors without code changes. Leave: define leave types (name, deductibility, default entitlement), reasons and sub-reasons, routing rules per position/department, and Sunday exemptions. Finance: allowance types (replace-on-upload vs. cumulative), loan types (stackable or non-stackable), savings types, payslip types, per-office rates (overtime, night differential, holiday pay, OJT), and loan deduction frequencies.

Evaluation: frequency (quarterly or monthly), fiscal year start month, and per-employee task lists. Training: survey templates and supervisor routing rules (by position/department, up to 3 steps). Survey: templates with any combination of 11 question types, anonymous or attributed mode, and targeting (all or specific employees). General settings: shifts, offices (with assigned shifts), departments, lines, positions, and employment types. Feedback & Updates: globally enable/disable the feedback modal and publish What's New version notes.

17. Conclusion

REPConect brings the company's core HR processes together into one secure, web-based system. By combining time logging, leave, payroll information, training, performance reviews, IT support, and company communication in a single place, it removes much of the manual paperwork and back-and-forth that these tasks used to require.

For everyday users, the system is designed to be straightforward: log in with your Employee ID, use the left-side menu, and follow the on-screen steps. The built-in approval workflows make sure each request reaches the right people in the right order, while real-time notifications keep everyone informed of what needs their attention.

Behind the scenes, REPCONnect is built on a layered, defense-in-depth security model — protecting login sessions, validating every input, guarding against common web attacks, and keeping an immutable record of all actions. Together with configurable settings that let administrators adapt the system without code changes, this makes REPCONnect a reliable, secure, and flexible foundation for managing the full employee lifecycle at Ryonan Electric Philippines Corporation.

For issues not covered in this document, please use the Troubleshooting Guide first, then reach out to the IT/MIS team or your HR administrator.
